Symantec Internet Threat Meter  
Web Activities

 **LOW RISK**  
Use Basic Caution

### No significant malicious activity

Although no widespread attacks are currently targeting web users, take normal precautions while viewing sites because of ongoing threats such as script-based attacks and phishing attacks that use fake sites.

#### How They Attack **Phishing**

#### How You Know

- Fraudulent websites are used to steal personal information
- Phishing attacks re-direct victims to a bogus Web site where malicious code is downloaded and used to collect sensitive information

#### What To Do

- When visiting a website, type the address directly into the browser rather than following a link
- Only provide personal information on sites that have "https" in the web address or have a lock icon at bottom of the browser
- Do not provide personal information to any unsolicited requests for information
- Confirm authenticity of a Web site with **Norton Internet Security**
- Allow only authorized programs to connect to the Web with **Norton Internet Security**
- Do not accept or open suspicious error dialogs from within the browser
- Spyware may come as part of a "free deal" offer - Do not accept free deals
- Install product updates and security patches before using the internet
- Keep web browser up to date with latest patches
- Make sure your computer is configured securely
- Automatically shield newly discovered security holes with **Norton Internet Security**

#### **Spyware**

- Many "free" programs downloaded from the web install software that tracks your behavior and displays unwanted advertisements
- Some web pages will attempt to install spyware when you visit their page

#### **Vulnerabilities**

- A vulnerability in the web browser may create a weakness in the computer security providing an opportunity for some websites to download malicious code
